

(Affiliated to University of Mumbai)

Branch: CSE(IoT&CSIBCT)

Year/ Semester: SE/III

Time: 03 hours

Note: 1. All questions are compulsory.

2. Figures to right indicate full marks.

3. Assume suitable data wherever necessary.

Marks

Q. 1 Attempt any FOUR. (All questions carry equal marks)

20

A. Differentiate between linear and nonlinear data structure.

05

Point	Linear DS	Non-linear DS
Structure	Sequential	Hierarchical/Network
Traversal	Single-level	Multi-level
Examples	Array, Stack, Queue, Linked List	Tree, Graph
Memory	Contiguous/linked	Non-contiguous
Implementation	Easy	Complex

B. Construct B tree of order 5 using following elements

7,11,1,20,5,15,18,9,12,37,34,8,42,24

[7]
/ \

[1, 5] [11, 15, 20]

[7, 15]
/ | \

[1, 5] [9, 11] [18, 20]

[7, 15, 34]
/ | | \

[1, 5] [8,9,11,12] [18,20,24] [37,42]

Rules of insertion explained – 1 mark
Correct splits – 2 marks
Final correct tree structure – 2 marks

C. Explain adjacency list and adjacency matrix representation of graph with example.

- Definition of adjacency matrix – 1 mark
- Example matrix – 1.5 marks
- Definition of adjacency list – 1 mark
- Example list – 1.5 marks

D. Explain binary search algorithm with example.

- Binary Search principle – 1 mark
- Algorithm/Pseudocode

		– 2 marks • Example – 2 marks																																																								
E.	Apply fractional knapsack algorithm problem for the following. $n = 6$, $p = (18, 5, 9, 10, 12, 7)$ $w = (7, 2, 3, 5, 3, 2)$, Max sack capacity $M = 13$. <table><tr><td>Item</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td></tr><tr><td>profit</td><td>18</td><td>5</td><td>9</td><td>10</td><td>12</td><td>7</td></tr><tr><td>weight</td><td>7</td><td>2</td><td>3</td><td>5</td><td>3</td><td>2</td></tr><tr><td>P/W</td><td>2.57</td><td>2.5</td><td>3</td><td>2</td><td>4</td><td>3.5</td></tr></table> 2. Sort in descending order <table><tr><td>Item</td><td>5</td><td>6</td><td>3</td><td>1</td><td>2</td><td>4</td></tr><tr><td>profit</td><td>12</td><td>7</td><td>9</td><td>18</td><td>5</td><td>10</td></tr><tr><td>weight</td><td>3</td><td>2</td><td>3</td><td>7</td><td>2</td><td>5</td></tr><tr><td>P/W</td><td>4</td><td>3.5</td><td>3</td><td>2.57</td><td>2.5</td><td>2</td></tr></table> Step 3: Fill the Knapsack Greedily • Item 5: weight = 3 → remaining = 10 → profit = 12 • Item 6: weight = 2 → remaining = 8 → profit = 12 + 7 = 19 • Item 3: weight = 3 → remaining = 5 → profit = 19 + 9 = 28 • Item 1: weight = 7 → only 5 units fit → take 5/7 fraction → profit = 28 + $(18 \times 5/7) = 28 + 12.86 \approx 40.86$ ◆ Maximum Profit ≈ 40.86	Item	1	2	3	4	5	6	profit	18	5	9	10	12	7	weight	7	2	3	5	3	2	P/W	2.57	2.5	3	2	4	3.5	Item	5	6	3	1	2	4	profit	12	7	9	18	5	10	weight	3	2	3	7	2	5	P/W	4	3.5	3	2.57	2.5	2	• Compute p/w ratio – 2 marks • Sort items – 1 mark • Pick items fractionally – 1 mark • Final max profit – 1 mark
Item	1	2	3	4	5	6																																																				
profit	18	5	9	10	12	7																																																				
weight	7	2	3	5	3	2																																																				
P/W	2.57	2.5	3	2	4	3.5																																																				
Item	5	6	3	1	2	4																																																				
profit	12	7	9	18	5	10																																																				
weight	3	2	3	7	2	5																																																				
P/W	4	3.5	3	2.57	2.5	2																																																				
F.	Solve the sum of subsets problem using backtracking approach. Set = {1, 9, 7, 5, 18, 12, 20, 15}, $n=8$ and sum value = 35 Using backtracking, the valid subsets are: {1, 5, 9, 20} {1, 7, 12, 15} {5, 12, 18} {7, 9, 18}	• Backtracking approach described – 2 marks • Recursive tree / tracking – 2 marks • One valid subset(s) result – 1 mark																																																								
Q.2	Attempt any FOUR. (All questions carry equal marks)																																																									
A.	Write C program to implement Queue using singly linked list. <pre>#include <stdio.h> #include <stdlib.h> // Structure of a node struct Node { int data; struct Node* next; }; struct Node* front = NULL; struct Node* rear = NULL; // Function to insert element into the queue (Enqueue) void enqueue(int value) { struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));</pre>	• Node structure – 2 marks • enqueue() – 3 marks • dequeue() – 3 marks • display() – 2 marks																																																								

	<pre> newNode->data = value; newNode->next = NULL; if (front == NULL && rear == NULL) { front = rear = newNode; } else { rear->next = newNode; rear = newNode; } printf("%d inserted into the queue.\n", value); } // Function to remove element from the queue (Dequeue) void dequeue() { if (front == NULL) { printf("Queue is empty! Cannot dequeue.\n"); return; } struct Node* temp = front; printf("%d removed from the queue.\n", front->data); front = front->next; if (front == NULL) { rear = NULL; } free(temp); } // Function to display the queue void display() { if (front == NULL) { printf("Queue is empty!\n"); return; } struct Node* temp = front; printf("Queue elements: "); while (temp != NULL) { printf("%d -> ", temp->data); temp = temp->next; } printf("NULL\n"); } // Main function int main() { int choice, value; while (1) { printf("\n--- Queue using Singly Linked List ---\n"); </pre>	
--	--	--

	<pre> printf("1. Enqueue\n"); printf("2. Dequeue\n"); printf("3. Display\n"); printf("4. Exit\n"); printf("Enter your choice: "); scanf("%d", &choice); switch (choice) { case 1: printf("Enter value to insert: "); scanf("%d", &value); enqueue(value); break; case 2: dequeue(); break; case 3: display(); break; case 4: exit(0); default: printf("Invalid choice! Please try again.\n"); } } return 0; } </pre>	
B.	Explain B+ tree and construct B+ tree of order 5 using following elements. 6,10,1,21,5,15,19,9,12,38,35,7,43,25 ☐ Node capacity: - Internal nodes: Max $M - 1 = 4$ keys. - Leaf nodes: Max $M - 1 = 4$ keys. - Min keys per node: $\lceil M/2 \rceil - 1 = 2$ (except root). Internal Nodes: <pre> [15, 25] / \ [1,5,6,10] [9,12,15,19,21] [25,35,38,43] </pre> Leaf Nodes (linked list): [1,5,6,10] → [9,12,15,19,21] → [25,35,38,43]	• Explanation – 2 marks • Insertions – 4 marks • Final tree – 4 marks
C.	Explain doubly linked list node structure and write c code for doubly linked list for inserting node at the beginning, end of the list and display the list. <pre> #include <stdio.h> #include <stdlib.h> struct Node { </pre>	• Node structure – 2 marks • Insert at beginning – 2 marks • Insert at end – 2 marks • Display – 2 marks • Explanation/comment in

	<pre> int data; struct Node* prev; struct Node* next; }; struct Node* head = NULL; void insertAtBeginning(int value) { struct Node* newNode = (struct Node*)malloc(sizeof(struct Node)); newNode->data = value; newNode->prev = NULL; newNode->next = head; if (head != NULL) { head->prev = newNode; } head = newNode; printf("%d inserted at the beginning.\n", value); } void insertAtEnd(int value) { struct Node* newNode = (struct Node*)malloc(sizeof(struct Node)); newNode->data = value; newNode->next = NULL; if (head == NULL) { newNode->prev = NULL; head = newNode; printf("%d inserted at the end.\n", value); return; } struct Node* temp = head; while (temp->next != NULL) { temp = temp->next; } temp->next = newNode; newNode->prev = temp; printf("%d inserted at the end.\n", value); } void displayList() { if (head == NULL) { printf("List is empty.\n"); return; } struct Node* temp = head; printf("Doubly Linked List: "); </pre>	g – 2 marks
--	---	--------------------

	<pre> while (temp != NULL) { printf("%d <-> ", temp->data); temp = temp->next; } printf("NULL\n"); } </pre>	
D.	Describe AVL tree with all rotations. 1. Right Rotation (LL Rotation) - Used when a node is inserted in the left subtree of the left child - Example: <pre> 30 / 20 / 10 </pre> Rotation at 30: <pre> 20 / \ 10 30 </pre>	• Definition – 2 marks • Left rotation – 2 marks • Right rotation – 2 marks • LR rotation – 2 marks • RL rotation – 2 marks
	2. Left Rotation (RR Rotation) - Used when a node is inserted in the right subtree of the right child - Example: <pre> 10 \ 20 \ 30 </pre> Rotation at 10: <pre> 20 / \ 10 30 </pre>	
	3. Left-Right Rotation (LR Rotation) - Used when a node is inserted in the right subtree of the left child - Example: <pre> 30 / 10 \ 20 </pre> Step 1: Left Rotation at 10 Step 2: Right Rotation at 30 Final tree: <pre> 20 </pre>	

	<pre> / \ 10 30 </pre>	
	4. Right-Left Rotation (RL Rotation) - Used when a node is inserted in the left subtree of the right child - Example: <pre> 10 \ 30 / 20 </pre> Step 1: Right Rotation at 30 Step 2: Left Rotation at 10 Final tree: <pre> 20 / \ 10 30 </pre>	
E.	Construct Minimum cost spanning tree (MST) using Kruskal's and Prim's method  Kruskal algorithms: - Sort edges by weight (ascending): - Now pick edges in order, avoiding cycles: - Pick B–C (2) → connect B and C. - Pick C–F (2) → connect F into component {B,C,F}. - Pick C–D (3) → connect D → component {B,C,F,D}. - Pick D–E (3) → connect E → component {B,C,F,D,E}. - Next candidate F–E (3) would form a cycle among {B,C,F,D,E} → skip. - Next pick A–B (4) → connects A to the component. - Selected edges (Kruskal): B–C (2), C–F (2), C–D (3), D–E (3), A–B (4) Total weight = 2 + 2 + 3 + 3 + 4 = 14 Prims algorithms: Start at C. At each step pick the smallest weight edge crossing the current tree boundary. Initial tree: {C} Edges out of C: B(2), F(2), D(3), A(4), E(4) - Pick B–C (2) → tree {C,B} New available edges (from tree): C–F(2), C–D(3), A–B(4), A–	- Graph/example – 2 marks - Kruskal steps – 3 marks - Prim steps – 3 marks - Final MST cost – 2 marks

	C(4), C–E(4) 2. Pick C–F (2) → tree {C,B,F} New available edges: C–D(3), D–E(3), F–E(3), A–B(4), A–C(4), C–E(4) 3. Pick C–D (3) → tree {C,B,F,D} New edges: D–E(3), F–E(3), A–B(4), A–C(4), C–E(4) 4. Pick D–E (3) → tree {C,B,F,D,E} (F–E would create cycle — skip) 5. Finally pick A–B (4) (or A–C(4)) → tree includes A Selected edges (Prim): C–B (2), C–F (2), C–D (3), D–E (3), A–B (4) Total weight = 14 (same as Kruskal)	
F.	What is graph coloring problem? Apply graph coloring technique and find chromatic no. of a graph.  Step-by-Step Coloring of Graph Your graph has 8 nodes: a, b, c, d, e, f, g, h: - Start with node g (most connected: degree 5) - Assign Color 1 to g - Nodes adjacent to g: e, f, a, b, c - Assign: Color 2 to e Color 3 to f Color 2 to a (not adjacent to e) Color 3 to b (not adjacent to f) Color 4 to c (adjacent to b and g) 3.	• Definition – 2 marks • Steps of coloring – 5 marks • Chromatic number – 3 marks

	<table><tr><th>Vertex</th><th>Color</th></tr><tr><td>g</td><td>1</td></tr><tr><td>e</td><td>2</td></tr><tr><td>f</td><td>3</td></tr><tr><td>a</td><td>2</td></tr><tr><td>b</td><td>3</td></tr><tr><td>c</td><td>4</td></tr><tr><td>d</td><td>3</td></tr></table> Chromatic Number = 4	Vertex	Color	g	1	e	2	f	3	a	2	b	3	c	4	d	3	
Vertex	Color																	
g	1																	
e	2																	
f	3																	
a	2																	
b	3																	
c	4																	
d	3																	
Q.3	Attempt any FOUR																	
A.	Explain BFS technique and write an algorithm of BFS in detail. BFS (Breadth First Search) • BFS is a graph traversal technique. • It visits all the vertices level by level. • It uses a queue (FIFO) data structure. • Works for connected and disconnected graphs. • Useful for finding shortest path in unweighted graphs, cycle detection, etc. □ BFS Algorithm (Adjacency List) BFS(G, start): 1. Create a boolean array visited[V] initialized to false 2. Create an empty queue Q 3. Mark visited[start] = true and enqueue start into Q 4. While Q is not empty: a. u = Dequeue Q b. Print u (or process it) c. For every neighbor v of u: if visited[v] == false: visited[v] = true Enqueue v into Q Time Complexity: O(V + E)	• Definition & Concept of BFS 1 mark • Explanation of working/technique 1.5 marks • BFS algorithm 2 marks • Example 0.5 mark																
B.	Explain graph traversal techniques in detail. Graph traversal = visiting all vertices systematically. Two main techniques: a) BFS (Breadth First Search) • Uses Queue • Level-wise traversal • Best for shortest path (unweighted)	• Definition of hashing 1 mark • Explanation of hashing need/use 0.5 mark • Static hashing 1 mark • Collision resolution techniques 1.5 marks																

	Example Order: $A \rightarrow B \rightarrow C \rightarrow D \rightarrow E$ b) DFS (Depth First Search) • Uses Stack (or Recursion) • Explores as deep as possible before backtracking	• Example 1 mark																																				
C.	Apply Linear Probing, Quadratic Probing on following data: 89, 18, 49, 58, 69. The hash table size $m = 10$ and the hash function $h(k) = k \bmod 10$. • Linear Probing Formula: $(h(k) + i) \bmod m$ <table> <thead> <tr> <th>Key</th> <th>$h(k)$</th> <th>Position</th> </tr> </thead> <tbody> <tr> <td>89</td> <td>9</td> <td>9</td> </tr> <tr> <td>18</td> <td>8</td> <td>8</td> </tr> <tr> <td>49</td> <td>9</td> <td>9 (occupied) $\rightarrow 0$</td> </tr> <tr> <td>58</td> <td>8</td> <td>8 (occupied) $\rightarrow 9$ (occupied) $\rightarrow 0$ (occupied) $\rightarrow 1$</td> </tr> <tr> <td>69</td> <td>9</td> <td>9, 0, 1, 2 $\rightarrow 2$</td> </tr> </tbody> </table> • Quadratic Probing Formula: $(h(k) + i^2) \bmod m$ <table> <thead> <tr> <th>Key</th> <th>$h(k)$</th> <th>Position</th> </tr> </thead> <tbody> <tr> <td>89</td> <td>9</td> <td>9</td> </tr> <tr> <td>18</td> <td>8</td> <td>8</td> </tr> <tr> <td>49</td> <td>9</td> <td>$9 \rightarrow (9 + 1^2) \% 10 = 0$</td> </tr> <tr> <td>58</td> <td>8</td> <td>$8 \rightarrow (8 + 1^2) = 9 \rightarrow (8 + 2^2) = 12 \% 10 = 2$</td> </tr> <tr> <td>69</td> <td>9</td> <td>$9 \rightarrow 0 \rightarrow (9 + 2^2) = 13 \% 10 = 3$</td> </tr> </tbody> </table>	Key	$h(k)$	Position	89	9	9	18	8	8	49	9	9 (occupied) $\rightarrow 0$	58	8	8 (occupied) $\rightarrow 9$ (occupied) $\rightarrow 0$ (occupied) $\rightarrow 1$	69	9	9, 0, 1, 2 $\rightarrow 2$	Key	$h(k)$	Position	89	9	9	18	8	8	49	9	$9 \rightarrow (9 + 1^2) \% 10 = 0$	58	8	$8 \rightarrow (8 + 1^2) = 9 \rightarrow (8 + 2^2) = 12 \% 10 = 2$	69	9	$9 \rightarrow 0 \rightarrow (9 + 2^2) = 13 \% 10 = 3$	•
Key	$h(k)$	Position																																				
89	9	9																																				
18	8	8																																				
49	9	9 (occupied) $\rightarrow 0$																																				
58	8	8 (occupied) $\rightarrow 9$ (occupied) $\rightarrow 0$ (occupied) $\rightarrow 1$																																				
69	9	9, 0, 1, 2 $\rightarrow 2$																																				
Key	$h(k)$	Position																																				
89	9	9																																				
18	8	8																																				
49	9	$9 \rightarrow (9 + 1^2) \% 10 = 0$																																				
58	8	$8 \rightarrow (8 + 1^2) = 9 \rightarrow (8 + 2^2) = 12 \% 10 = 2$																																				
69	9	$9 \rightarrow 0 \rightarrow (9 + 2^2) = 13 \% 10 = 3$																																				
D.	Define hashing and explain different types of hashing techniques with example. Hashing A technique to store and retrieve data in constant time ($O(1)$) using a hash function to compute an index. ☐ Hash Function $h(k) = k \bmod m$ ☐ Types of Hashing 1. Division Method $h(k) = k \bmod m$ Example: key=19, $m=10 \rightarrow 19 \bmod 10 = 9$ 2. Multiplication Method $h(k) = \text{floor}(m * (k * A \bmod 1))$ Example: $A=0.618$, $m=10$ 3. Mid-square Method Square the key and take middle digits. 4. Folding Method Break key and sum parts. Collision Resolution • Linear Probing • Quadratic Probing	• Definition of hashing 1 mark • Explanation of hashing need/use 0.5 mark • Static hashing 1 mark • Collision resolution techniques (LP/QP/Chaining) 1.5 marks • Example/application 1 mark																																				

	• Double Hashing • Separate Chaining																						
E.	Find Dijkstra's shortest path from vertex 0 for following graph . Iteration Steps - Start at 0: $0 \rightarrow 1 = 10 \rightarrow$ update distance of 1 to 10 $0 \rightarrow 4 = 3 \rightarrow$ update distance of 4 to 3 - Visit 4 (min distance = 3): $4 \rightarrow 3 = 2 \rightarrow$ update distance of 3 to 5 $4 \rightarrow 1 = 1 \rightarrow 3 + 1 = 4 \rightarrow$ update distance of 1 to 4 - Visit 1 (min distance = 4): $1 \rightarrow 2 = 5 \rightarrow 4 + 5 = 9 \rightarrow$ update distance of 2 to 9 - Visit 3 (min distance = 5): - No outgoing edges - Visit 2 (min distance = 9): $2 \rightarrow 3 = 7 \rightarrow$ already visited, no update - Vertex 5 remains unreachable <table border="1"> <thead> <tr> <th>Vertex</th><th>Distance</th><th>Path</th></tr> </thead> <tbody> <tr> <td>0</td><td>0</td><td>0</td></tr> <tr> <td>1</td><td>4</td><td>$0 \rightarrow 4 \rightarrow 1$</td></tr> <tr> <td>2</td><td>9</td><td>$0 \rightarrow 4 \rightarrow 1 \rightarrow 2$</td></tr> <tr> <td>3</td><td>5</td><td>$0 \rightarrow 4 \rightarrow 3$</td></tr> <tr> <td>4</td><td>3</td><td>$0 \rightarrow 4$</td></tr> <tr> <td>5</td><td>∞</td><td>—</td></tr> </tbody> </table>	Vertex	Distance	Path	0	0	0	1	4	$0 \rightarrow 4 \rightarrow 1$	2	9	$0 \rightarrow 4 \rightarrow 1 \rightarrow 2$	3	5	$0 \rightarrow 4 \rightarrow 3$	4	3	$0 \rightarrow 4$	5	∞	—	• Initial table setup (distance & visited array) 1 mark • Step-by-step relaxation process 2 marks • Final shortest path values 1.5 marks • Diagram/justification 0.5 mark
Vertex	Distance	Path																					
0	0	0
